# Mutual funds' performance, ratings and flows

1 High stock ownership by retail-owned mutual funds

**Empirical Analysis** 

- Pinancial advice play a central role in driving flows and shaping financial markets
- Morningstar ratings are the most prominent financial advice that U.S. mutual fund investors follow
- Morningstar ratings were broadly aligned with mutual funds' past performance
- 6 Mutual fund flows can generate large price pressure in the underlying stocks

past performance  $\rightarrow$  ratings  $\rightarrow$  flows  $\rightarrow$  price pressure

rating-driven demand  $\rightarrow$  systematic price fluctuations?

#### Before June 2002

Author

 Morningstar rated all mutual funds, regardless of their style-tilts, based on their performance ranking

**Empirical Analysis** 

- Fund ratings were highly dependent on style
- Following the dot-com crash, many fund managers complained that their ratings dropped sharply and argued that ratings barely reflected contributions

#### After June 2002

- Morningstar began benchmarking funds against peer funds within their style
- The revised methodology removes the style-performance component from the fund ranking

## Fund ratings became balanced across styles

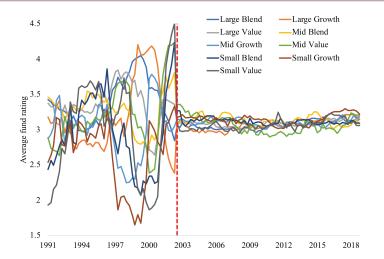

Figure 1: Morningstar fund rating by style

- Author
- 2 Background
- 3 Data
- 4 Empirical Analysis
- **6** Conclusion

# Variable: Mutual fund sample

 Monthly fund returns and total net assets from CRSP (Ret<sub>i,t</sub> and TNA<sub>i,t</sub> for fund j in month t)

**Empirical Analysis** 

- Quarterly fund holdings from Thomson Reuters' S12
- Ratings and style categories from Morningstar Direct

The fund flow is defined as the net flow into the fund divided by lagged TNA:

$$Flow_{j,t} = \frac{TNA_{j,t}}{TNA_{j,t-1}} - (1 + Ret_{j,t})$$

# Variable: Stock- and style-level ratings

#### **Stock**-level ratings:

$$\text{Rating}_{i,t}^{\text{stock}} = \frac{\sum_{\text{fund } j \in J} \text{SharesHeld}_{i,j,t-1} \cdot \text{Rating}_{j,t}}{\sum_{\text{fund } j \in J} \text{SharesHeld}_{i,j,t-1}}$$

$$\Delta \text{Rating}_{i,t}^{\text{stock}} = \frac{\sum_{\text{fund } j \in J} \text{SharesHeld}_{i,j,t-1}(\text{Rating}_{j,t} - \text{Rating}_{j,t-1})}{\sum_{\text{fund } j \in J} \text{SharesHeld}_{i,j,t-1}}$$

#### Style-level ratings:

$$\text{Rating}_{\pi,t}^{\text{style}} = \sum_{i \in \text{style } \pi} w_{i,t-1}^{\pi} \cdot \text{Rating}_{i,t}^{\text{stock}}$$

$$\Delta \text{Rating}_{\pi,t}^{\text{style}} = \sum_{i \in \text{style } \pi} w_{i,t-1}^{\pi} \cdot \Delta \text{Rating}_{i,t}^{\text{stock}}$$

$$w^{\pi}_{i,t-1} = \frac{\sum_{\text{fund } j \in \text{style } \pi} \text{Price}_{i,t-1} \cdot \text{SharesHeld}_{i,j,t-1}}{\sum_{\text{fund } j \in \text{style } \pi} \text{TNA}_{j,t-1}}$$

## Exogenous?

 While the reform was prompted by the dot-com crash and therefore did not occur on a random date, its exact timing is exogenous

**Empirical Analysis** 

- Morningstar rarely changes its methodology
- The reform is arguably the most significant change to date
- Investors' rating-chasing behavior did not change around the dot-com bust or the 2002 reform
- Unrelated to the specific channel of rating-induced flows and price pressures that we are interested in

**Empirical Analysis** ••••••••

- Background
- Data
- 4 Empirical Analysis
- Conclusion

#### How to examine the mechanism?

- 1 The key elements of the mechanism exist
  - Rating-chasing behavior
  - Flow-induced trades create price pressure
- ② Rating-driven demand → systematic return pattern
  - Effects of rating changes on style flows and returns
  - Examine the rating-driven style momentum strategy

**Empirical Analysis** 

- Cross-sectional dispersion in style flows and returns
- Event study
  - Performance of styles, by predicted rating impact
  - Placebo test: Other years
  - Other factors that may have affected style returns
  - Controlling for stock characteristics

**Empirical Analysis** 

## Part I: Rating-Chasing Behavior and Price Impact

- Investors chase ratings regardless of rating methodology
- Stock-level rating-induced price pressures
- Return predictability in the cross-section of stock returns

## Investors chase ratings regardless of rating methodology

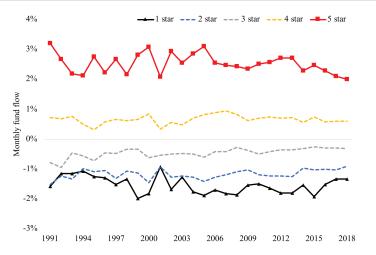

Figure 2: Average flows to mutual funds with different ratings

Haotian Deng SUFE
Ratings-Driven Demand and Systematic Price Fluctuations 14 / 32

## Investors chase ratings regardless of rating methodology

**Empirical Analysis** 

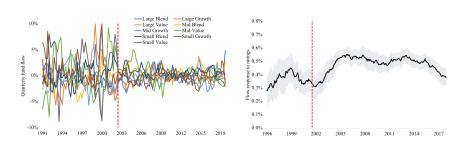

Figure 3: Relation between Morningstar ratings and fund flows

Author

- $\blacksquare$  Rating changes  $\rightarrow$  Fund flows
  - Flow<sub>i,t</sub> =  $a + b_1 \Delta \text{Rating}_{i,t-1} + \cdots + b_{36} \Delta \text{Rating}_{i,t-36} + \gamma X_{j,t} + u_{j,t}$ • Cumulative response coefficients:  $b_1, b_1 + b_2, \cdots$

**Empirical Analysis** 

- When controlling for past fund performance, discrete changes in ratings cause sizeable differences in flows
- ② Flow-induced trading → Stock returns
  - Flow-induced trading:  $FIT_{i,t} = \frac{\sum_{\text{fund } j \in J} \text{SharesHeld}_{i,j,t-1} \cdot \text{Flow}_{j,t}}{\sum_{\text{fund } i \in J} \text{SharesHeld}_{i,j,t-1}}$
  - $Ret_{i,t} = a + c_0 \cdot FIT_{i,t} + c_1 \cdot FIT_{i,t-1} + ... + c_{36} \cdot FIT_{i,t-36} + u_{i,t}$
  - Cumulative response:  $c_0, c_0 + c_1, \cdots$
  - Immediate price pressure in the contemporaneous month and a complete reversion in the subsequent 1 to 2 years

#### Stock-level rating-induced price pressures

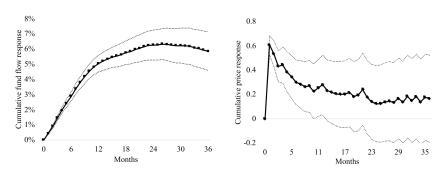

Figure 4: Rating changes, flow-induced trading and returns

### Stock-level rating-induced price pressures

• Estimate the response of stock returns on the past 24 lags of stock-level rating changes

**Empirical Analysis** 

 Summarize past rating changes using ExpSum( $\triangle \text{Rating}$ )<sub>i,t-1</sub> =  $\sum_{k=1}^{12} \tau_k \cdot \triangle \text{Rating}_{i,t-k}$ , where  $\tau_k = \frac{12 \cdot (1-\delta)}{1-\delta/2} \cdot \delta^{k-1}$  and  $\delta = 0.76$ 

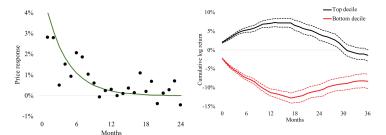

Figure 5: rating changes → stock return

Haotian Deng SUFE Ratings-Driven Demand and Systematic Price Fluctuations 18 / 32

## Return predictability in the cross-section of stock returns

**Empirical Analysis** 

$$\text{Return}_{i,t} = d_1 \Delta \text{Rating}_{i,t-1-h \rightarrow t-1} + \gamma^s X_{i,t}^s + \gamma^f X_{i,t}^f + u_{i,t}$$

Return predictability from ratings and stock characteristics

## Cross-sectional dispersion in style flows and returns

If "ratings drive flows and then lead to price impact" is correct, we should observe a decline in the dispersion in style flows and returns after the reform

**Empirical Analysis** 

Dispersion of style ratings, flows, and returns

	Ra	ting	Flov	v (%)	Return (%)	
Dependent variables:	Spread (1)	SD (2)	Spread (3)	SD (4)	Spread (5)	SD (6)

## Part III: Event study

 An additional and independent test of rating-induced demand effects on style returns

**Empirical Analysis** 

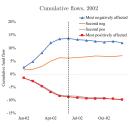

- Ensure that the rating changes are primarily caused by the methodology change
- Reduces the chance that our findings are confounded by other events

# Performance of styles, by predicted rating impact

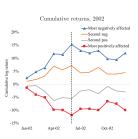

$$\widehat{\Delta Rating_j} = Rating_{j,Dec\ 2001}^{counterfactual} - Rating_{j,Dec\ 2001}^{actual}$$

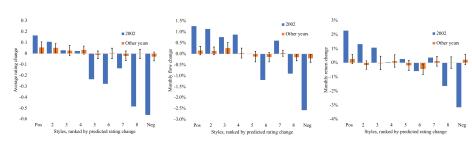

Cumulative style flows

Cumulative style returns

# Placebo test: Other years

#### Rerunning in all years other than 2002

Ratings change: 2002 vs. placebo

Flow change: 2002 vs. placebo

Return change: 2002 vs. placebo

## Other factors that may have affected style returns

- Event study methodology assumes that no other sudden style-level shocks occurred around June 2002 that could have caused the patterns
- The in-existence of such shocks is a key assumption that merits further validation

**Empirical Analysis** 

- No discernible sudden change in fundamentals (ROA) and ROE) around June 2002
- 2 13F institutions traded into (out of) styles with high (low) pre-2002 ratings, before halting suddenly right after June 2002
- 3 A general slow rise in short interest across all styles over the window but no clear change around the event

Haotian Deng SUFF Ratings-Driven Demand and Systematic Price Fluctuations

## Controlling for stock characteristics

 One might still argue that our results could be driven by sudden characteristics-related return changes that happened for other reasons

**Empirical Analysis** 

- "Predicted rating changes explain return changes" also take place at the stock level after controlling for size and book-to-market ratio characteristics
- Even after controlling for characteristics, we should still expect to see an effect

```
\mathsf{Rating}_{i.t}^{\mathsf{idiosyncratic}} = \mathsf{Rating}_{i,t} - \mathsf{Rating}_{\mathsf{size-book/market\ portfolio}\ p,t}
       \mathsf{Ret}^{\mathsf{idiosyncratic}}_{i\ t} = \mathsf{Ret}_{i,t} - \mathsf{Ret}_{\mathsf{size-book/market\ portfolio}}\ p,t
```

**Empirical Analysis** 

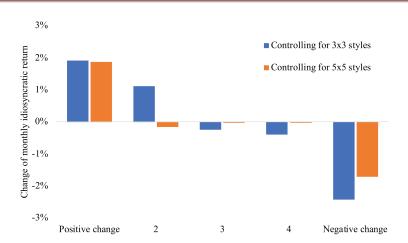

Figure 6: Stocks sorted by predicted idiosyncratic rating

- Background
- Data
- **Empirical Analysis**
- **6** Conclusion

#### Conclusion

Author

- Morningstar rating-driven household demand for mutual funds contributes to economically significant price fluctuations at the style level
- These findings should alter the way economists interpret systematic price movements: instead of solely reflecting fundamental risks, they also may be determined by non-fundamental demand

Thanks!
